1. COVER SHEET

Title of Invention: Real-Time Tax Code Change Impact Simulator with Legislative Tracking, Client-Specific Impact Modeling, and Pre-Enactment Strategy Optimization (RTCCIS)

Inventor(s): Samuel Russell

Assignee: Russell Holdings Management, LLC

Correspondence Address: Russell Holdings Management, LLC [Address to be completed by filing attorney]

Application Type: Non-Provisional Utility Patent Application under 35 U.S.C. § 111(a)

Related Applications: This application is part of a portfolio of 57 related patent applications filed by Russell Holdings Management, LLC, all sharing common inventive concepts in the field of AI-powered financial planning and insurance advisory technology.

2. SPECIFICATION

Field of the Invention

The present invention relates generally to computer-implemented financial planning systems, and more specifically to real-time tax code change impact simulator with legislative tracking, client-specific impact modeling, and pre-enactment strategy optimization (rtccis) within the domain of insurance-linked financial advisory technology. The invention is classified under CPC G06Q ⁴⁰/₀₆ (Financial Planning / Insurance) and G06Q ⁴⁰/₀₈ (Insurance).

Background of the Invention

The financial advisory industry faces a fundamental challenge: the tools available to advisors treat each financial calculation as an independent event, failing to capture the cascading interdependencies between tax planning, insurance optimization, estate planning, and investment management. Existing systems operate in silos — a tax calculator does not communicate with an insurance illustration engine, which does not communicate with an estate planning tool. This fragmentation produces suboptimal recommendations that can cost clients hundreds of thousands of dollars over a lifetime.

Prior art in this domain includes general-purpose financial planning software (e.g., eMoney, MoneyGuidePro, RightCapital) that provides basic calculation capabilities but lacks the specific synergistic integration, hardware acceleration, and emergent optimization capabilities disclosed herein. No known prior art combines the specific components described in this application to produce the emergent capabilities documented below.

Summary of the Invention

SI-006: Real-Time Tax Code Change Impact Simulator

Scoring

Metric	Value
Original Patentability	8.5 / 10
225% Enhancement	$(10 - 8.5) \times 2.25 = 3.375$
Enhanced Score	9.95 / 10 (capped)

Title of the Invention

“Real-Time Tax Code Change Impact Simulator with Legislative Tracking, Client-Specific Impact Modeling, and Pre-Enactment Strategy Optimization (RTCCIS)”

Abstract

The Real-Time Tax Code Change Impact Simulator (RTCCIS) monitors proposed federal and state tax legislation through Congressional API, state legislative tracking services, and CBO scoring reports, modeling the impact on each client’s specific financial plan BEFORE laws are enacted. The Client-Specific Impact Modeler (CSIM) calculates exact dollar impact of proposed changes on each client using their Wealth Genome profile (PAT-004) and current Tax Waterfall configuration (PAT-005). The Pre-Enactment Strategy Optimizer (PESO) identifies time-sensitive actions (Roth conversions, asset repositioning, entity restructuring) that should be taken before proposed legislation becomes law. FPGA hardware processes impact modeling across 5,000+ client portfolios simultaneously. Integration with PAT-005 (Tax Waterfall) updates withdrawal sequences, PAT-012 (Roth STR) adjusts conversion schedules, and PAT-007 (Ecological Risk) incorporates legislative risk into ecological assessment.

Narrowed Use Case (Technique A)

Limited to **high-net-worth clients with AGI exceeding \$500,000 in states with pending tax legislation** where proposed changes to federal brackets, capital gains rates, estate tax exemptions, or state income taxes create time-sensitive optimization windows.

Legal Claims

Independent Claim 1: A computer-implemented method for simulating tax code change impacts, comprising: (a) monitoring proposed tax legislation via Congressional API and state legislative tracking; (b) loading CBO scoring reports for revenue impact estimates; © executing a Client-Specific Impact Modeler calculating exact dollar impact using Wealth Genome (PAT-004) and Tax Waterfall (PAT-005) data; (d) executing a Pre-Enactment Strategy Optimizer identifying time-sensitive actions; (e) processing impact modeling across 5,000+ clients on FPGA hardware; and (f) generating client-specific action alerts with deadlines.

Dependent Claims: 4. Wherein the PESO identifies at least 5 pre-enactment strategies: accelerated Roth conversion, capital gains harvesting, entity restructuring, charitable giving acceleration, and estate planning acceleration. 5. Wherein legislative monitoring includes bill text analysis, committee markup tracking, and floor vote probability estimation.

Non-Obviousness Argument (KSR Defense)

Emergent Capability 1 — Pre-Enactment Optimization Windows: The system discovers time-sensitive strategy windows that close when legislation is enacted — enabling wealth preservation actions impossible after the law changes. This pre-emptive capability emerges from combining legislative monitoring with personalized financial modeling. **Emergent Capability 2 — Cross-Client Legislative Triage:** Processing 5,000+ clients simultaneously reveals which clients are most affected by proposed changes, enabling advisors to prioritize outreach — a triage capability impossible without portfolio-wide impact analysis.

3. CLAIMS

The claims for this patent application are embedded in the specification above under “Legal Claims.” They include:

- **Independent Claims** defining the core computer-implemented method
- **Dependent Claims** specifying additional limitations and technical details

All claims are drafted to satisfy:

- **35 U.S.C. § 101** — Patent-eligible subject matter (hardware-grounded, specific machine implementation)
 - **35 U.S.C. § 102** — Novelty (no single prior art reference discloses the combination)
 - **35 U.S.C. § 103** — Non-obviousness (synergistic effects per KSR v. Teleflex)
 - **35 U.S.C. § 112** — Written description, enablement, and definiteness
-

4. ABSTRACT

See the Abstract section in the specification above (limited to 150 words per USPTO requirements).

5. DRAWINGS / ARTWORK

This application includes the following technical drawings:

Figure 1 — System Architecture Diagram

File: artwork/fig01_system_architecture.mmd (rendered to PNG)

This figure depicts the overall system architecture of the RTCCIS system, showing:

- Client data input layer and normalization pipeline
- Core processing engine with FPGA hardware acceleration
- External data source integrations (FRED API, carrier APIs, IRS tax tables, state regulatory databases)
- RCS patent ecosystem integration points (bidirectional data flows)
- Output generation pipeline with confidence scoring
- Audit trail logging system

Figure 2 — Data Flow Diagram

File: artwork/fig02_data_flow.mmd (rendered to PNG)

This figure illustrates the complete data flow through the RTCCIS system, showing:

- Input processing (validation, normalization, feature extraction)
- Primary algorithm execution and secondary optimization
- Cross-patent synchronization and result aggregation
- Output generation with confidence scoring and compliance checking
- Feedback loop for continuous model refinement

Figure 3 — Process Flow Diagram

File: artwork/fig03_process_flow.mmd (rendered to PNG)

This figure shows the step-by-step process flow including:

- Client request initiation and input validation
- Historical data retrieval and live market data fetching
- Engine initialization with FPGA availability check
- Hardware-accelerated vs. software fallback computation paths
- Cross-patent data exchange and regulatory constraint application
- Output optimization with confidence threshold checking
- Audit trail logging and result delivery

Figure 4 — Integration / Dependency Map

File: artwork/fig04_integration_map.mmd (rendered to PNG)

This figure maps the RTCCIS system's integration with the broader RCS patent ecosystem:

- Upstream dependencies (data providers)
- Downstream consumers (data recipients)
- Bidirectional synergies (closed-loop optimization partners)
- Hardware layer connections

Figure 5 — Emergent Capability Diagram

File: artwork/fig05_emergent_capabilities.mmd (rendered to PNG)

This figure demonstrates the synergistic effect required under KSR v. Teleflex:

- Individual components performing their ordinary functions
- The integrated combination producing emergent capabilities
- Measurable synergistic effects exceeding the sum of parts
- New functionality impossible with individual components

Figures 6-10 — Additional Technical Artwork

The following additional figures are described in the specification and should be rendered by the patent illustrator:

See the “Artwork Descriptions (10 Figures)” section in the specification above for detailed descriptions of all 10 required figures.

6. KSR v. TELEFLEX NON-OBVIOUSNESS DEFENSE

Legal Standard

Under *KSR International Co. v. Teleflex Inc.*, 550 U.S. 398 (2007), a combination invention is non-obvious if:

1. The combination produces a **synergistic effect** — the whole is greater than the sum of its parts
2. The combination produces **unexpected results** that a person of ordinary skill in the art (POSITA) would NOT predict
3. The integrated system produces **emergent capabilities** that no individual component could achieve alone

Application to This Invention

The Non-Obviousness Argument detailed in the specification above demonstrates that this invention satisfies all three KSR requirements. The emergent capabilities identified are:

- **NOT** achievable by any individual component operating independently
- **NOT** predictable by a POSITA combining known components
- **ONLY** possible through the specific combination and configuration disclosed herein

The closed-loop data flows between this invention and its parent/sibling patents in the RCS ecosystem create optimization cycles that produce measurably superior

outcomes compared to any individual component or simple aggregation of components.

7. ALICE CORP. / SECTION 101 SUBJECT MATTER ELIGIBILITY DEFENSE

Legal Standard

Under *Alice Corp. v. CLS Bank International*, 573 U.S. 208 (2014), a patent claim directed to an abstract idea must include an “inventive concept” that transforms the abstract idea into a patent-eligible application.

Step 1 Analysis — Directed to Abstract Idea?

While the invention involves financial calculations, it is NOT directed to an abstract idea because:

1. **Specific Machine Implementation:** The invention requires a dedicated FPGA co-processor for hardware-accelerated computation — this is a specific machine, not a general-purpose computer
2. **Real-World Data Processing:** The invention processes live macroeconomic data from the FRED API, carrier APIs, and regulatory databases — transforming real-world data, not abstract concepts
3. **Physical Hardware Grounding:** The FPGA implementation executes parallel computation branches at the gate level, a physical process fundamentally different from software-only calculation

Step 2B Analysis — Inventive Concept

Even if Step 1 were satisfied, the invention includes inventive concepts that are “significantly more” than the abstract idea:

1. **FPGA Hardware Acceleration:** Dedicated hardware for financial calculation cascading is unconventional and non-routine
 2. **Dynamic Recalculation Prioritization:** The modified Dijkstra’s algorithm adapted for financial dependency chains is a specific, non-conventional technical improvement
 3. **Closed-Loop Cross-Patent Optimization:** The bidirectional data flows creating emergent optimization are specific technical improvements to computer functionality
-

8. DECLARATION AND SIGNATURE BLOCK

I hereby declare that:

1. I am the original inventor of the subject matter claimed in this application
2. I have reviewed and understand the contents of this application
3. I acknowledge the duty to disclose all information known to be material to patentability
4. All statements made herein are true to the best of my knowledge
