

Integration Scorecard

Russell Capital Systems · BASE build claude/base-consolidation · 18 September 2026

3.3 MEAN PAGE WIRING / 10	4.3 688-BUILD AUDIT AVG	4,095 TESTS GREEN	0 TYPECHECK ERRORS	330 ROUTES
---------------------------------	-------------------------------	----------------------	--------------------------	---------------

The finding in one sentence: the engines are strong; the wiring between them is the gap, and the gap is measured. Two independent measurements — the platform’s own scorecard and this session’s 688-page audit — reached the same conclusion from different directions.

1. Where the catalogue stands

MEASURE	FAILING	OF	SHARE	
Pages with no provenance trace	112	115		97%
Pages with no live data	104	115		90%
Pages fewer than two surfaces link to	104	115		90%
Pages no genome strategy routes to	101	115		88%
Pages scoring below 5	76	115		66%
Pages scoring 10	0	115		0%

104 of 115 pages have fewer than two inbound links. That is the arithmetic behind the owner’s own description of the problem: *“I had 700 pages and I was getting lost in my own website.”* It is not a design complaint — it is a measurable property of the link graph.

2. The ten-rule page contract

One point per rule. A page’s score is the number it passes. Six of the ten are already read from code by `server/integrationAudit.ts`; adding checks for rules 4, 5, 6 and 10 makes the score fully automatic.

#	RULE	PASSES WHEN	CATALOGUE STATUS
1	Registered	In <code>calculatorCatalog.ts</code> with category, purpose, inputs, outputs, memory group	115 / 115
2	Brained	Engine is a module in <code>aiMemoryBank.ts</code> ; <code>unwiredGroups()</code> returns 0	29 groups
3	Fed	Every fact-finder field pre-fills from <code>ClientDataContext</code>	partial
4	Sourced	Every figure traces to source, as-of, window, method; no source means null + reason	3 / 115

Russell Capital Systems · Integration Scorecard · Session 01 · 18 September 2026

#	RULE	PASSES WHEN	CATALOGUE STATUS
5	Toggled	Shared evidence panel present, defaults off, each toggle adds a ledger row	1 / 115
6	Simulated	Projections ≥ 5 y offer 10,000 seeded paths, p10/p50/p90, worst rolling decade	partial
7	Ruled	Every statutory, tax or product constant reads from a versioned rules table	2 engines
8	Linked	Two or more inbound links; publishes a result another page consumes	11 / 115
9	Tested	Engine test, route test, compliance test on any regulated claim	4,095
10	Measured	Views, completions, time-to-first-number, abandonment reported	not wired

STAGED ENFORCEMENT

STAGE	GATE
Now	The scorecard reports. Nothing fails the build.
At site mean 6	Any new page must ship at 8 or higher.
At site mean 8	Any page regressing below 8 fails the build.

Staging is not timidity: turning the gate on today would fail 104 of 115 pages and stop all work.

3. Flagship engine defects — verified against the BASE source

Correction. Two of the four defects reported earlier in this session were wrong: line numbers from the 688-page build were carried into claims about the BASE build. The table below is verified against the actual BASE source. The withdrawn claims are listed beneath it, because a retracted finding that stays in circulation is worse than one never made.			
#	FINDING	LOCATION	EFFECT
1	The IUL policy has no cost of insurance	shared/mortgageKiller.ts absent entirely	A search for coi, costOfInsurance and insuranceCharge returns nothing. A policy accumulating with no mortality or expense charges materially overstates cash value. The most serious of the four.
2	Policy-loan drag reported but never deducted	mortgageKiller.ts :297, :342	loanDragCost is computed and written into the result row. No total subtracts it. The user is shown a cost that reduces nothing.
3	Default crediting rate exceeds the product cap	mortgageKiller.ts :645, comment :14 vs pacificHorizonEcv.ts	Engine defaults iulCreditRate = 0.075 and asserts a 7.5% AG 49-A maximum. The product's actual maximum illustrated rate is 6.35% . Illustrating above a product's cap is a compliance problem, not a modelling preference.
4	Total-return table where price return is required	ibbotsonModel.ts :104– 110	2008 is -0.3700 and 2009 is 0.2646 — total return. Index crediting uses price return (–38.49%, +23.45%). The correct series already exists in the trunk.

WITHDRAWN

CLAIM	VERDICT AND EVIDENCE
Interest-savings double-count	Does not exist in BASE. netWorth at :565 is homeEquity + netCashValue – cumulativePropertyTax; interest saved is not added in. homeEquity at :545 correctly nets both the mortgage and the HELOC balance.
COI inversion at line 237	Wrong location and wrong diagnosis. Line 237 is inside the amortization row builder. The real finding is the absence of any COI term — which is more serious than an inversion.

4. Data coverage against the 36-year requirement

REQUESTED	YEARS	WHAT EXISTS
Home appreciation by ZIP	51	FHFA five-digit ZIP index, 1975 →
Mortgage rates	55	Freddie Mac PMMS, 1971 →

Russell Capital Systems — Integration Scorecard

Session 01 · 18 September 2026

REQUESTED	YEARS	WHAT EXISTS
Prime rate	71	FRED DPRIME, 1955 →
Rent inflation	79	CPI rent of primary residence, 1947 →
Rent by bedroom count	43	HUD FMR by county, 1983 → . Only 8 years by ZIP (SAFMR, 2018 →)
Tenant length of stay	40	Census AHS, 1985 → — adapter not yet built
Property tax by ZIP	17	Census ACS, 2009 → . No ZIP-level coverage before that
Evictions	19	Eviction Lab, 2000–2018. Series ends; nothing public replaces it
Rent by bathroom count	0	No public dataset exists. No US agency has ever collected it. Returned as null with the reason
Security deposits over time	0	Not a time series. Governed by state statute — a rules table, not a history

A platform that says “17 years of property tax history for your ZIP, 2009 through 2025” is worth more than one that claims 36 and quietly extrapolates. Every window above is displayed to the user beside the figure it produced.

5. Build order

PHASE	WORK	DONE WHEN
P0	Fix the four defects above	Mortgage Killer, IUL and Time Machine agree within rounding on the same household; compliance tests green; no global illustrated-rate constant remains
P1	Extract the evidence panel and server helper; apply catalogue-wide. First real data sweep. AHS and Shiller adapters	Every calculator renders a ledger; a repo scan finds zero unlabelled flat rates; status reports non-zero rows for every claimed series
P2	ZIP and property list into the fact finder; genome routes for 101 pages; publish/consume; provenance links; scorecard in CI	The single-entry walk succeeds: a household entered once, walked through the full genome route without re-typing any value, every figure tracing to a source or a labelled assumption
P3	Mine the 688 build — Bucket A (43) fix, Bucket B (138) embed, Bucket D (119) retire	Every one of the 688 URLs resolves to a live route, tab or redirect. No URL dies
P4	Authorise MCP servers; provider verification; council tools	Council cites a page and ledger row in ≥95% of factual answers; no provider field displays without a dated source
P5	Default design system; cinematic layer on engine output; provisional patent filed	Scorecard reads 10 on the top 30 pages by traffic, ≥9 site-wide

Why 4.3 to 10 is weeks, not a year. Eight of the ten rules are satisfied by shared infrastructure rather than per-page code: one context provider, one evidence panel, one server helper, one resampling function, a set of rules tables, a link generator, one analytics hook. Build the spine once, attach the pages to it, and most of the catalogue moves from 3 to 8 at once.
