

Top 10 Open-Source Platforms for Russell Capital Solutions

Prepared by Manus AI — June 2026

Based on the full scope of what Sam Russell is building — Russell Capital Solutions (a financial advisory platform with AI tools), the sam-russell-corpus, interconnected lightweight systems, and multi-model AI collaboration — these are the 10 platforms from the 100 researched that deliver the highest strategic value.

10/10 — Maximum Impact

1. n8n — Workflow Automation Platform

Attribute	Detail
GitHub	https://github.com/n8n-io/n8n
Stars	194,300+
Tier	Legendary
Category	Workflow Automation

What it is: A fair-code workflow automation platform with 400+ integrations, native AI/LangChain capabilities, visual building with custom JavaScript/Python code, and self-hosted or cloud deployment with enterprise features like SSO.

Why it benefits you: You’re already using Zapier MCP, but n8n gives you a self-hosted visual automation engine with 400+ integrations and custom code nodes. Perfect for automating your advisory workflows, syncing data between your tools, and building AI agent pipelines — without per-task fees.

Deploy:

```
docker run -it --rm --name n8n -p 5678:5678 -v n8n_data:/home/node/.n8n d
```

2. Dify — LLM Application Development Platform

Attribute	Detail
GitHub	https://github.com/langgenius/dify
Stars	146,800+
Tier	Legendary
Category	LLM App Platform

What it is: A production-ready LLM application development platform with a visual workflow builder, robust RAG pipelines, an agent framework, comprehensive model management supporting hundreds of LLMs, and built-in observability.

Why it benefits you: You’re building AI-powered financial tools. Dify gives you a visual platform to build RAG applications, AI agents, and prompt workflows without writing boilerplate. You could build your calibration systems, coaching tools, and client-facing AI features faster than having Manus code them from scratch.

Deploy:

```
docker compose up -d
```

3. Supabase — Backend-as-a-Service

Attribute	Detail
GitHub	https://github.com/supabase/supabase
Stars	104,900+
Tier	Legendary
Category	Backend-as-a-Service

What it is: An open-source Firebase alternative providing a complete backend stack centered around PostgreSQL — with built-in auth, auto-generated REST/GraphQL APIs, real-time subscriptions, edge functions, file storage, and vector embeddings.

Why it benefits you: Your website needs auth, database, realtime features, and storage. Supabase gives you all of that with a Postgres backend, auto-generated APIs, and edge functions. It's the entire backend for Russell Capital in one deploy.

Deploy:

```
docker compose up -d
```

9/10 — High Impact

4. Coolify — Self-Hosted PaaS

Attribute	Detail
GitHub	https://github.com/coolabsio/coolify
Stars	57,400+
Tier	Legendary
Category	Platform-as-a-Service

What it is: A self-hostable PaaS alternative to Heroku, Netlify, and Vercel that manages servers, deploys static sites, full-stack applications, databases, and 280+ one-click services with automated Git-push deployments, free SSL, and backups.

Why it benefits you: You're deploying apps and managing infrastructure. Coolify gives you a self-hosted Vercel/Heroku — push code, get deployments, free SSL, database management. Stop paying cloud premiums and own your hosting.

Deploy:

```
curl -fsSL https://cdn.coolabs.io/coolify/install.sh | bash
```

5. Cal.com — Scheduling Infrastructure

Attribute	Detail
GitHub	https://github.com/calcom/cal.com
Stars	45,900+
Tier	Excellent
Category	Scheduling

What it is: A fully customizable scheduling platform with calendar integrations, booking pages, team scheduling, payments, and video conferencing — while allowing full control over events, data, workflow, and appearance.

Why it benefits you: As a financial advisor, scheduling is core to your business. Cal.com gives you a complete booking system with calendar sync, payments, and video conferencing — fully branded and self-hosted.

Deploy:

```
docker compose up -d
```

8/10 — Strong Impact

6. Payload CMS — TypeScript Headless CMS

Attribute	Detail
GitHub	https://github.com/payloadcms/payload
Stars	43,300+
Tier	Excellent
Category	Headless CMS

What it is: A fullstack Next.js framework and headless CMS with authentication, granular access control, localization, versions/drafts, a Lexical rich text editor, and a block-based layout builder — all in TypeScript.

Why it benefits you: Your website is Next.js/React. Payload is a full TypeScript CMS that integrates natively with Next.js — giving you content management, access control, localization, and a rich editor without building a custom admin panel.

Deploy:

```
npx create-payload-app@latest
```

7. Chatwoot — Customer Engagement Platform

Attribute	Detail
GitHub	https://github.com/chatwoot/chatwoot
Stars	33,600+
Tier	Excellent
Category	Customer Engagement

What it is: A comprehensive omnichannel customer support platform centralizing conversations from live chat, email, social media, and messaging apps into a single shared inbox — with AI assistant, Help Center, CRM tools, and reporting dashboards.

Why it benefits you: Client engagement is everything in financial advisory. Chatwoot gives you live chat, email inbox, WhatsApp integration, and AI-assisted responses — a complete client communication hub for your practice.

Deploy:

```
docker compose up -d
```

8. Langflow — Visual AI Workflow Builder

Attribute	Detail
GitHub	https://github.com/langflow-ai/langflow
Stars	150,100+
Tier	Legendary
Category	LLM App Platform

What it is: A visual framework for building, iterating, and deploying AI-powered agents and RAG applications with drag-and-drop components, built-in API and MCP servers, and enterprise-ready observability integrations.

Why it benefits you: You’re using multiple AI models (Grok, Anthropic, OpenAI, Gemini). Langflow lets you visually build multi-agent workflows and RAG applications that combine all of them — drag-and-drop instead of spending credits on custom integration code.

Deploy:

```
docker run -p 7860:7860 langflowai/langflow:latest
```

7/10 — Solid Impact

9. Docusaurus — Documentation Site Generator

Attribute	Detail
GitHub	https://github.com/facebook/docusaurus
Stars	65,400+
Tier	Legendary
Category	Static Site Generator

What it is: A modern static-site generator built with React that provides document versioning, internationalization, full-site search, blog, and a pluggable architecture for building beautiful documentation sites.

Why it benefits you: You have patents, coaching frameworks, and extensive documentation. Docusaurus turns all of that into a professional, searchable, versioned documentation site in minutes — perfect for client-facing knowledge bases or internal reference.

Deploy:

```
npx create-docusaurus@latest my-website classic
```

10. PocketBase — Backend in a Single File

Attribute	Detail
GitHub	https://github.com/pocketbase/pocketbase
Stars	59,300+
Tier	Legendary
Category	Backend-as-a-Service

What it is: An open-source Go backend bundling an embedded SQLite database with real-time subscriptions, built-in file and user management, an Admin dashboard UI, and a REST API — all in a single portable executable.

Why it benefits you: For your smaller projects, prototypes, or internal tools — PocketBase is an entire backend (auth, database, file storage, admin panel) in a single executable file. Zero infrastructure overhead for quick builds.

Deploy:

```
wget https://github.com/pocketbase/pocketbase/releases/latest/download/po
```

Strategic Takeaway

Platforms 1-3 alone could fundamentally change how you build. Instead of spending credits having Manus write custom backends, auth systems, and AI pipelines from scratch, you deploy these and then use Manus for the custom business logic, integrations, and unique features that make Russell Capital different.

Use These Platforms For	Use Manus Credits For
Auth, database, storage, realtime	Custom business logic unique to RCS
Workflow automation and integrations	Gluing systems together
AI agent frameworks and RAG pipelines	Specialized prompts and calibration systems
Scheduling, CMS, client communication	Branding, design, and UX customization
Hosting and deployment infrastructure	One-off scripts and data processing
